Laboratory Assignment

IEMS 5710 Crypto., Info. Security and Privacy (2nd Trimester, 2024-25) **Full Mark: 100**

Deadline: 23:59 HKT 28 December 2024

Objectives

This assignment covers some key topics we will cover in the lectures. Upon completion, you will be able to:

- Establish a secure communication channel using public-key encryption
- Change the access level of a file in a Linux machine
- Write some simple SQL queries for querying a database
- Write an HTML webpage file to interact with a "web application" written in PHP

(This "laboratory assignment" is designed to provide you with first-hand experiences in security-related computing environments. You are advised to complete at least the first three parts of the question early to have some hands-on experience before you commit to taking this course.)

1 Encryption and Decryption using GPG4WIN (25%)

1.1 Installation

- 1. Download GPG4WIN from the following URL: https://www.gpg4win.org/download.html.
- 2. Click the download button.

Gpg4win 4.4.0 (Released: 2024-11-27)

You can download the full version (including the Gpg4win compendium) of Gpg4win 4.4.0 here:

3. Select "\$0" and start to download. // Well, you can always choose to donate :)

| Please donate for Gpg4win to support maintenance and development! Pay what you want! – Thank you! | | | | | | | | |
|--|------------|------|---------|---------|--|--|--|--|
| Donate with | PayPal | | | | | | | |
| PayPal | | | | | | | | |
| O Bitcoin | \$0 \$10 | \$15 | \$25 | | | | | |
| Bank transfer | | | | | | | | |
| | | | | | | | | |
| | USD | EUR | onetime | monthly | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | 🕁 Download | | | | | | | |

- 4. Double-click the file to start the installation process.
- 5. Select the default option.

| 🔒 Gpg4win 安裝 | | - 🗆 X |
|----------------|--|--|
| Gpg4win | 選擇元件 選擇想要安裝 Gpg4win 的功能。 | |
| 勾選想要安裝的元件, | 並解除勾選不想安裝的元件。 按「 | 下一步(N)」繼續。 |
| 選取安裝的元件: | GnuPG Okular (GnuPG Edition) Kleopatra GpgOL GpgEX Browser integration | 說明 將滑鼠指標停懸到元 件之上,即可見到其 說明。 |
| 所需空間: 124.6 MB | | |
| Gpg4win-4.4.0 | <上一步(B) | 下一步(N) > 取消 |

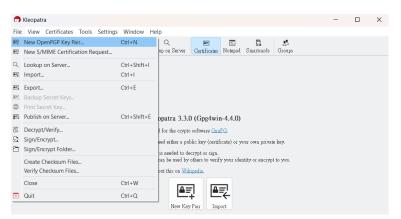

6. Finally, select "Run Kleopatra" and press Finish.

| 🔒 Gpg4win 安裝 | | — | | \times |
|-------------------|--------------------------------------|------|----|----------|
| Gpg4win | 即將完成安裝 Gpg4win | | | |
| GnuPG for Windows | 已在電腦安裝 Gpg4win。 按 [完成(F)] 關閉安裝程式。 | | | |
| | 🥑 Run Kleopatra | | | |
| | 點選此處訪問項目首頁 | | | |
| | <上一步(B) 完成 | λ(F) | 取消 | |

1.2 Generate a public and private key pair

This section demonstrates the steps to generate a public and private key pair in the system.

1. After the software has started, select **New OpenPGP Key Pair**. (Question you should ask yourself: What does "PGP" stand for? Google is your friend.)

2. Select **Create a personal OpenPGP key pair**, fill in your name and email address if you want, and tick the box "Protect the generated key with a passphrase" (Why?).

| 7 Create OpenPGP Certificate - Kleopatra | × |
|--|---|
| Enter a name and/or an email address to use for the certificate. | |
| Name | |
| Alice | |
| Email address | |
| | |
| Protect the generated key with a passphrase. | |
| Advanced options | |
| | |
| OK Cancel | |

You can click "Advanced options" for other available options. For example, you can increase the key length in the advanced setting dialog box. We will use the default options in this lab assignment. (Question to yourself: What are curve25519, nistp256, rsa2048?)

| Advanced options | |
|--------------------------------------|---|
| Key Material | |
| curve25519 | ~ |
| brainpoolP384r1 brainpoolP512r1 | |
| curve25519 | |
| curve448 | |
| nistp256 nistp384 | |
| nistp521 | |
| rsa2048 | |
| rsa3072 | |
| rsa4096 | |

3. Click **OK** to create the key pair.

4. Enter a password to protect your new (private) key.

5. Your new key pair has been created.

| 🗇 Succ | ess - Kleopatra | × |
|--------|---|----|
| | A new OpenPGP certificate was created successfully. | |
| | Fingerprint of the new certificate: 0C27 A851 87C3 9605 9DE8 A49B 4668 F023 D033 19 | F9 |
| | OK | |
| | | |

Figure 1: Generate a public and private key pair

1.3 Export your own public key

To establish a secure communication channel, you have to give your public key to others. This section details the steps to export your public key to a file so you can send it out.

1. After you press **OK** in the previous step, you will see the following box.

| n Kleopatra | а | | | | | | | | | - | |
|--------------|----------------------|-------------|---------|--------------|-----------------------|-------------------------|----------|--------------|-------------|---------------------|---|

| 11 | =V7cv |
| 12 | END PGP PUBLIC KEY BLOCK |

- 6. Save the file and name it [your name]_public_key.txt.
- 7. You can send this file to your partner for the following step.

1.4 Import others' public keys

You need other's public key to encrypt messages for secure communication. This section demonstrates the steps to import others' public keys into the system.

1. When you get the public key from others, open it with a text editor and copy the content to the clipboard.

| Fingerprint: F58F CC5C 6B78 F29B C802 E66B E984 D902 4D88 B55C Certify with: | ~ |
| Bob | |
| | |
| | |
| Advanced | |
| Certify | 🛇 Cancel |

5. Click OK. You may need to input the password that you have set in Section 1.2.

6. The public key of your partner has been imported successfully.

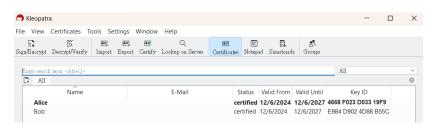

Figure 3: Import your partner's public key to the system

1.5 Encrypt messages by using the public key and sign by using your private key

After you have imported other's public key to the system, you can use his/her public key to encrypt a message and use your own private key to sign the message. This section demonstrates the steps to do so.

1. Open Kleopatra and select Notepad in the toolbar.

| 🗇 Kleopatra | | | | | | | | | - | | × |

Figure 4: Encrypt a message to your partner

5. You can copy and send the content as a file or by email.

1.6 Decrypt message by using the private key and verify using other's public key

After receiving the encrypted message from the sender, you can use your private key to decrypt the message and use the sender's public key to verify the sender's identity.

- 1. On the recipient's side, open Kleopatra and click the Notepad tab.
- 2. Paste the encrypted message to the box and click Decrypt/Verify Notepad.

| 🙃 Kleopatra | | - | × |

Figure 5: Decrypt an encrypted message from your partner

Your Tasks

In this question, you need to submit the following:

- Generate a public and private key pair (Figure 1).
- Export your public key to a file (Figure 2).
- Import your partner's public key to the system (Figure 3).
- Encrypt a message to your partner (Figure 4).
- Decrypt an encrypted message from your partner (Figure 5).

To show your work, you need to capture your computer screen in these steps (*i.e.*, Figures 1-5) and include them in your report. Optionally, you can include the long form of the acronyms you encountered.

2 Access Control in Linux Machine (25%)

2.1 Connect to a Linux VM

- 1. Go to the following URL: https://cocalc.com/doc/terminal.html.
- 2. Sign up for an account and click Your CoCalc Projects to start an Online Linux Terminal.

| \bigcirc | Your Projects | Store | Features | Docs | Share | Support | News | About | A Account V | |
|------------|-----------------|---------------|---------------|----------------|--|---|--|--------------|------------------------|-----|
| | 命 Jupyter Julia | a LaTeX Linux | Octave Python | R Stats SageMa | th Slides T | Feaching Termin | nal Whiteboard | X11 Comput | e Al Assistant Compare | API |
| | | echo 'Welc | ome to CoCalc | from Linux/BAS | 6H!' | ∠ Ed | it 🕽 Copy | 🕨 Run 🍯 Ba | sh (Linux) | |

3. Click My First Project.

| 🖉 Projects | Deleted Hidden | | |
|--|-------------------|---------------------------------|---|
| Search for projects (use /re/ for regexp) | Q | Search for filenames you edited | ٩ |
| | ⑦ Create Project | | |
| My First Project less than a minute ago | ▶ 8 | 🖈 Running | |
| | Show all projects | | |

4. After entering the project, you can type commands in "Terminal command...".

| <u>()</u> 2 P | Projects 👳 🌐 My First Project | \times | + 🕂 Help | A Account | 0 | |
|-----------------|-------------------------------|----------|----------|-------------------------|----------|---------|
| 습 | | | | | | |
| <u>/</u> | | | ⊕ New ∨ | Filter files (/ for ter | minal) | Q |
| Tabs | | | | Terminal command. | | ⊘ |
| Explorer | | | L 🛛 | () Ø | ۵ | 1) Tour |
| New C Log | No files found | | | | | |

2.2 Create a sample file

1. Type the following command in the shell and press enter to execute it:

echo "This is a test file" > test_1.txt

- echo is a command for displaying something on the console display.
- > is a symbol for redirecting from the console display.
- test_1.txt will be the destination for the above redirection.

Simply put, the effect is it will create a file called test_1.txt with one line. Warning: it *overwrites* the file if the file exists.

2. Execute the following command to list the file in the current directory:

ls -1

- 1s is a command for listing directory (folder in Windows terminology) contents.
- 1s -1 means "using a long listing format."
- You can try ls --help or man ls to know more about ls.

After running the command, you should be able to see the following:

| 0 4 | <u>∕</u> F | Projects | 🖈 🌐 | My Firs | t Project | × | + | ₽ ŀ | lelp | A Acc | count | \square | 0 | (((- | |
|----------------------|------------|---------------------------|-----|-----------|-------------|--------------|------|-----|------|----------|-----------|-----------|-------|---------------------|------|

| Find | Þ | | | E | test_1.txt | | | | | | | ninute a | - | nouu _y . | /iew |

2.3 Set the access level of a file in a Linux machine

1. In Linux, we use the chmod command with the following syntax to set/change the access level of a file:

chmod [option] permissions file_name

- There are three kind of users: u = owner, g = the group where the file belongs to, o = others.
- Also, there are three kinds of access restrictions: r = 4 = read, w = 2 = write, x = 1 = execute.
- Here, option is not necessary to set.
- 2. To **add** the **executing** permission of test_1.txt to the **owner**, we execute the following:

chmod u+x test_1.txt

3. To remove the reading permission of test_1.txt to the group of users and others:

chmod g-r,o-r test_1.txt

4. To add the reading, writing, and executing permission to the owner, group of users, and others:

chmod u+wxr,g+rwx,o+rwx test_1.txt

The above command is equivalent to the following **numerical** representations:

chmod 777 test_1.txt

Here 7 equals +wxr (4 + 2 + 1).

Your Tasks

In this question, you need to submit the **command** to do the following:

- 1. Create a file named [the last 4 digits of your SID].txt with "Submission to Q2" as content.
- 2. Set the following access restriction of the above file using **numerical** representations:
 - (a) Give the **reading**, writing, and executing permission to the owner.
 - (b) Give the **reading** permission to the **group of users**.
 - (c) Give the executing permission to others.
- 3. Set the following access restriction of the above file using **alphabetical** representations:
 - (a) Remove the **executing** permission to the **owner** and **others**.
 - (b) Give the **writing** permission to the **group of users**.

3 Basic SQL (25%)

3.1 Connect to the SQL Online IDE

- Go to the following URL: https://sqliteonline.com.
- To run a query, just click **Run** or press **Shift + Enter**.

3.2 Learn SQL

Structured Query Language (SQL) is a database query language that allows the management of data in a relational database. In this part, we provide some basic SQL query examples to give you a taste of how they work, which helps you better understand SQL injection, to be covered in the lecture later.

1. **CREATE** a table named users_info with three columns: ID (unique int), username (varchar(225)), password (varchar(225)): (Question to yourself: What are NOT NULL, UNIQUE, VARCHAR?)

```
CREATE TABLE users_info (
ID INT NOT NULL UNIQUE,
username VARCHAR(225) NOT NULL,
password VARCHAR(225) NOT NULL
);
```

Once a table is created, it cannot be created again; hence, the above query can be run only once. To DELETE the table, we use DROP:

```
DROP TABLE users_info;
```

A query ends with ";".

2. **INSERT** the following rows into user_info:

```
INSERT INTO users_info (ID, username, password)
VALUES (1, 'Alice', 'Alice2004'),
(2, 'Bob', '123456'),
(3, 'Carol', 'password'),
(4, 'Dave', 'dddd'),
(5, 'Eve', 'dwerty'),
(6, 'Alice', 'AlicE2004');
```

(Question to yourself: Are the above passwords strong enough? If no, what makes a stronger password?)

3. **SELECT** all columns of users_info:

SELECT * FROM users_info;

You should see the following output:

| i ID | username | password |
|------|----------|-----------|
| 1 | Alice | Alice2004 |
| 2 | Bob | 123456 |
| 3 | Carol | password |
| 4 | Dave | dddd |
| 5 | Eve | qwerty |
| 6 | Alice | AlicE2004 |

Figure 6: Select the table users_info after creation and insertion

4. **SELECT** specific columns from users_info:

| SI | SELECT ID, username FROM users_info; | | | |
|----|--------------------------------------|----------|--|--|
| | | | | |
| | : ID | username | | |
| | 1 | Alice | | |
| | 2 | Bob | | |
| | 3 | Carol | | |
| | 4 | Dave | | |
| | 5 | Eve | | |
| | 6 | Alice | | |

5. Use the **WHERE** clause to filter some of the records:

| <pre>SELECT * FROM users_info WHERE username='Alice';</pre> | | | | |
|---|----------|-----------|--|--|
| | | | | |
| i D | username | password | | |
| 1 | Alice | Alice2004 | | |
| 6 | Alice | AlicE2004 | | |

6. Use the **LIKE** operator to search for records containing a specific pattern: Username starts with "a":

```
SELECT * FROM users_info WHERE username LIKE 'a%';

Ind

Username

Alice

Alice2004

Alice2004

Alice2004
```

Username contains with "a":

| SELECT * FROM users_info WHERE username LIKE '%a%'; | | | | |
|---|----------|-----------|--|--|
| | | | | |
| : ID | username | password | | |
| 1 | Alice | Alice2004 | | |
| 3 | Carol | password | | |
| 4 | Dave | dddd | | |
| 6 | Alice | AlicE2004 | | |

Username ends with "e":

| <pre>SELECT * FROM users_info WHERE username LIKE '%e';</pre> | | | | | | |
|---|----------|-----------|--|--|--|--|
| | | | | | | |
| i ID | username | password | | | | |
| 1 | Alice | Alice2004 | | | | |
| 4 | Dave | dddd | | | | |
| 5 | Eve | qwerty | | | | |
| 6 | Alice | AlicE2004 | | | | |

7. Use the **BETWEEN** operator to select records given a range:

| S | ELECT * FROM users_info WHERE ID | BETWEEN 1 AND 3; | |
|---|----------------------------------|------------------|-----------|
| | | | |
| | i ID | username | password |
| | 1 | Alice | Alice2004 |
| | 2 | Bob | 123456 |
| | 3 | Carol | password |

8. Use **comparison** operators to select records given a condition. They can be:

| Operator | Description |
|----------|--------------------------|
| = | Equal to |
| > | Greater than |
| < | Less than |
| >= | Greater than or equal to |
| <= | Less than or equal to |
| <> | Not equal to |

Table 1: A list of comparison operators

SELECT * FROM users_info WHERE ID > 3;

| : ID | username | password |
|------|----------|-----------|
| 4 | Dave | dddd |
| 5 | Eve | qwerty |
| 6 | Alice | AlicE2004 |

9. Use AND, OR operator to select records based on more than one condition:

| SELECT * FROM use | ers_info WHERE ID | BETWEEN 1 AND 2 OR | username LIKE | '%e'; |
|-------------------|-------------------|--------------------|---------------|-----------|
| | | | | |
| i ID | | username | | password |
| 1 | | Alice | | Alice2004 |
| 2 | | Bob | | 123456 |
| 4 | | Dave | | dddd |
| 5 | | Eve | | qwerty |
| 6 | | Alice | | AlicE2004 |

10. Use **NOT** operator to select records that are not true for the given condition:

| ELECT * FROM users_info WHERE ID N | NOT BETWEEN 1 AND 3; | |
|------------------------------------|----------------------|-----------|
| | | |
| i ID | username | password |
| 4 | Dave | dddd |
| 5 | Eve | qwerty |
| 6 | Alice | AlicE2004 |

11. **CREATE** another table named purchase_record with three columns: ID (int), item (varchar(225)), date_of_purchase (date). **INSERT** the following records into purchase_record:

| i ID | item | date_of_purchase |
|------|--------------|------------------|
| 1 | cola | 2024-11-01 |
| 1 | shrimps | 2024-11-02 |
| 3 | orange juice | 2023-03-10 |
| 4 | chips | 2022-04-10 |
| 5 | chips | 2023-12-02 |
| 5 | apple | 2023-12-02 |
| 5 | lemon | 2023-12-04 |

Figure 7: Select the table purchase_record after creation and insertion

Try to write the query by yourself.

12. Use **ORDER BY** to sort the records based on some column(s); the default setting is in ascending order (**ASC** or **DSEC** to specify outputting in descending order):

| SELECT * FROM purchase_record ORDER BY date_of_purchase; | | | | |
|--|--------------|------------------|--|--|
| | | | | |
| : ID | item | date_of_purchase | | |
| 4 | chips | 2022-04-10 | | |
| 3 | orange juice | 2023-03-10 | | |
| 5 | chips | 2023-12-02 | | |
| 5 | apple | 2023-12-02 | | |
| 5 | lemon | 2023-12-04 | | |
| 1 | cola | 2024-11-01 | | |
| 1 | shrimps | 2024-11-02 | | |

13. Use a **JOIN** clause to combine the ID rows from users_info and purchase_record:

```
SELECT users_info.ID, users_info.username, purchase_record.item,
purchase_record.date_of_purchase
FROM users_info
JOIN purchase_record ON users_info.ID = purchase_record.ID;
```

| : ID | username | item | date_of_purchase |
|------|----------|--------------|------------------|
| 1 | Alice | cola | 2024-11-01 |
| 1 | Alice | shrimps | 2024-11-02 |
| 3 | Carol | orange juice | 2023-03-10 |
| 4 | Dave | chips | 2022-04-10 |
| 5 | Eve | chips | 2023-12-02 |
| 5 | Eve | apple | 2023-12-02 |
| 5 | Eve | lemon | 2023-12-04 |

14. Use the **UNION** operator to combine the result of two or more **SELECT** statements:

| SELECT ID FROM users_info UNION | |
|------------------------------------|--|
| SELECT item FROM purchase_record; | |
| | |
| i ID | |
| 1 | |
| 2 | |
| 3 | |
| 4 | |
| 5 | |
| 6 | |
| apple | |
| chips | |
| cola | |
| lemon | |
| orange juice | |
| shrimps | |

Your Tasks

In this question, you need to submit the **queries** and the **screenshot of the output** to do the following:

1. Create the table users_info (Figure 6) and insert the records, which includes an additional row:

- ID: [the last 4 digits of your SID]
- username: [your nickname]
- password: [any password you like]
- 2. Create the table purchase_record (Figure 7) and insert the records, which include an additional row:
 - SID: [the last 4 digits of your SID]
 - item: [anything you like]
 - date_of_purchase: [the date you conduct this task]
- 3. Join users_info and purchase_record on their ID; select the users_info.ID, users_info.username, purchase_record.item, purchase_record.date_of_purchase with date of purchase after "2023-12-03" and order the records by date of purchase in descending order.

4 Basic HTML (25%)

HTML stands for Hypertext Markup Language. It is the standard markup language for web documents. In this part, we will write simple HTML to interact with a PHP file using an online editor.

4.1 Start Coding with an Online Editor

1. Go to the following URL: https://html.onlineviewer.net

The left part of this website is a coding platform that allows you to write your code, and the right part is a preview pane showing your code's result.

| HTML Online Viewer | i 1 | Hello World! | Hello World! |
|-----------------------|-----|--------------|--------------|
| Preview (Full page) | | | |
| Highlight (Full page) | | | |
| Format | | | |
| Expand all | | | |
| Collapse all | | | |
| Sample | | | |
| Clear | | | |
| 1 Import | | | |
| 🛓 Export | | | |

4.2 HTML

1. We are going to write two HTML webpages, which submit your name and the last 4 digits of your SID to a "web file" written in PHP hosted at http://iems5710.42web.io.

In HTML, a tag (e.g., $\langle b \rangle \langle /b \rangle$) is used to tell the browser what the type of content is, and an element (e.g., $\langle b \rangle 12345 \langle /b \rangle$) is used to tell the browser what to display. In this part, we use $\langle form \rangle$ element to collect the inputs and submit them to the hosted PHP file via the GET or POST method.

2. Copy and paste the following code on the coding platform:

```
<html>
<head>
    <style>
        header {
            font-family: Verdana;
            font-size: 20pt;
            font-weight: bold;
            margin-bottom: 20px;
        }
        body {
            font-family: Verdana;
            font-size: 14pt;
            margin: 40px;
        }
    </style>
</head>
<body>
<header>
   Please input the following information and click Submit
</header>
<form action="http://iems5710.42web.io" method="get">
Name: <input type="text" name="name"><br>
Last 4 digits of your SID: <input type="text" name="sid"><br>
<input type="submit">
</form>
</body>
</html>
```

Then, the webpage is shown on the right part:

Please input the following information and click Submit

Name: ______ Last 4 digits of your SID: ______ Submit

- 3. Click **Preview (Full Page)** on the top-left to view the website in the full-page mode.
- 4. Input your name and last 4 digits of your SID on the boxes, then click the Submit button:

Your request method is GET Hi andes Your last 4 digits of your SID: 5710

You may see the warning "The information you're about to submit is not secure" before submitting the form. Click **Send anyway** for this task. (Question to yourself: Why does this warning appear, and what is the potential risk for submitting a form in this way?)

5. The above example uses the **GET** method to submit the request to the host. Now, let's modify the code to submit the request to the host via the **POST** method:

Change the following code in Step 1:

<form action="http://iems5710.42web.io" method="get">

to

<form action="http://iems5710.42web.io" method=post">

Your Tasks

In this question, you need to do the following:

- 1. Do Steps 1-3 for submitting GET and POST requests.
- 2. Take the screenshots of Step 3 and include them in your report.
- 3. From the response pages of both HTML files, what are the differences between the **GET** and **POST** methods? (Hints: look at the URL of the response pages.)

Assignment Submission

Put all screenshots, queries, and answers required in **Your Tasks** of each question into a PDF file. Please name the file in the following format: **1155001234 Chan Tai Man.pdf** Deadline: Dec 28th, 2024, 11:59 pm Hong Kong Time.

- End -
